INSIGHTS

Forced reflow

A forced reflow occurs when JavaScript queries geometric properties (such as offsetWidth) after styles have been invalidated by a change to the DOM state. This can result in poor performance. Learn more

LCP breakdown

Each sub-part has specific improvement strategies. Ideally, most of the LCP time should be spent on loading the resources, not within delays. LCP Unscored

Time to First Byte	260 ms
Element render delay	3,110 ms

Sub-part	Duration

Network dependency tree

Avoid chaining critical requests by reducing the length of chains, reducing the download size of resources or deferring the download of unnecessary resources to improve page load. LCP Unscored

Maximum critical path latency: **2,974 ms**

Initial Navigation

- https://tradebd.online - **1,383 ms,** 6.34 KiB
  - /assets/index-CdpP0Ga5.js (tradebd.online) - **2,974 ms,** 54.54 KiB
  - /assets/index-CQ76pKUM.css (tradebd.online) - **2,208 ms,** 10.76 KiB

Preconnected origins

preconnect hints help the browser establish a connection earlier in the page load, saving time when the first request for that origin is made. The following are the origins that the page preconnected to

Mobile Desktop

https://fonts.googleapis.com/	head > link `<link rel="preconnect" href="https://fonts.googleapis.com">`

https://fonts.gstatic.com/ `<link rel="preconnect" href="https://fonts.gstatic.com" crossorigin="">`

Preconnect candidates

Add preconnect hints to your most important origins, but try to use no more than 4.

No additional origins are good candidates for preconnecting

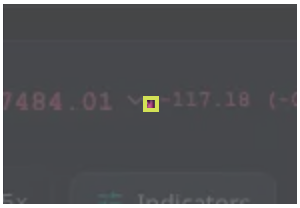

Render-blocking requests

Requests are blocking the page's initial render, which may delay LCP. Deferring or inlining can move these network requests out of the critical path. LCP FCP Unscored

Optimise DOM size

A large DOM can increase the duration of style calculations and layout reflows, impacting page responsiveness. A large DOM will also increase memory usage. Learn how to avoid an excessive DOM size. Unscored

Accessibility

These checks highlight opportunities to improve the accessibility of your web app. Automatic detection can only detect a subset of issues and does not guarantee the accessibility of your web app, so manual testing is also encouraged.

ADDITIONAL ITEMS TO MANUALLY CHECK (10) Hide

- Interactive controls are keyboard focusable
- Interactive elements indicate their purpose and state
- The page has a logical tab order
- Visual order on the page follows DOM order
- User focus is not accidentally trapped in a region
- The user's focus is directed to new content added to the page
- HTML5 landmark elements are used to improve navigation
- Offscreen content is hidden from assistive technology
- Custom controls have associated labels
- Custom controls have ARIA roles

These items address areas which an automated testing tool cannot cover. Learn more in our guide on conducting an accessibility review.
